Speaker 1: More than 7 million Americans are living with Alzheimer's, according to the Alzheimer's Association. UC Davis researcher Alyssa Weakley is working on eye care, a new technology that is helping Alzheimer's patients live longer in their own homes.

Alyssa Weakley: I have always been really invested in making lives of individuals with cognitive impairment better. But it has really hit home when my grandmothers start to have cognitive impairment. When individuals have cognitive decline, it not only impacts their memory, but it also impacts their ability to do things around their home. Eye care can assist with some of these activities.

Leeann Patton: I am just grateful to the bottom of my heart. She has already helped me, and she is going to affect people around the world.

Speaker 1: Federally funded research is improving lives. Learn more ucdavis.edu/labstolives
